SkyPro™ Embedded Phone

OVERVIEW

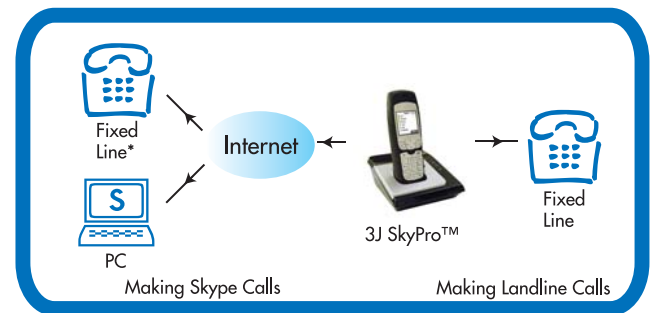

The 3J SkyPro™ is a stand-alone Skype DECT phone that allows users to access both the Public Switched Telephone Network (PSTN) and Skype network. The phone includes embedded Skype software, which incorporates most of the Skype features such as voicemail, call forwarding and Skype-In/Skype-Out services.

There is no need to have the Skype application running on a PC. Once the base station is connected to the internet, the handset will become an embedded Skype device and the user can make Skype-to-Skype calls, or Skype In/Out calls with fixed-line numbers.

The Skype user contact list is shown on a 1.5" color handset screen. The users can easily see their contacts status and profiles, as well as their Skype credit balances for SkypeOut.

There are separate call lists for both the PSTN and Skype Calls, and the users can easily identify the call lists as either from PSTN or Skype. The phone has speakerphone, blue keypad backlight and musical ring tones as standard features.

PSTN and Skype 2-in-1
